# Source of Disease and Close Contact of COVID-19 Confirmed Case

Source investigation:
14 days before tested positive

source | confirmed case (0) | close contact (1,2)

14 days
before tested positive (+)

14 days
after tested positive (+)

Close Contact Investigation:

Confirmed case (0) with positive test result (+)

0

Confirmed Case

◆ Person with positive test result has to be quarantined in the hospital or a cohort ward.

1

High Risk Contact
(person with close contact with (0))

◆ Carry on a conversation with confirmed case within 1-meter range for longer than 5 minutes or expose to confirmed case's droplets.

◆ Person in enclosed space without a proper ventilation system with confirmed case within 1-meter range for longer than 15 minutes.

2

Low Risk Contact
(person who are not considered as high risk contact)

Procedures for Close Contact

Screening/ Testing

◆ If any symptoms below have been developed; body temperature rises above 37.5 °C, cough, sore throat, having phlegm, breathing difficulty, panting, muscle pain or headache, go for a screening or a test immediately.

◆ At present, hospitals will conduct the screening/ testing only when symptoms are present.

14 days Home-Quarantine

◆ Monitor yourself. If any symptoms have been shown, go to the hospital for the screening/ testing.

◆ If there are no symptoms after 14 days, live normally and always wear mask.

7 days

Stay at home for 7 days. Then always wear mask when going out.

If (1) has shown symptoms and tested positive, (1) will become a confirmed case (0) and (2) will become (1) automatically. A home-quarantine is applied to complete the 14-day quarantine.
